

# Holistic Needs Assessment in Brain Cancer Patients: A Systematic Review of Available Tools

Janyne Afseth<sup>1</sup>, Lis Neubeck<sup>1</sup>, Thanos Karatzias<sup>1</sup>, and Robin Grant<sup>2</sup>  
 (1School of Health and Social Care, Edinburgh Napier University, 2Department of Neurology, NHS Lothian)

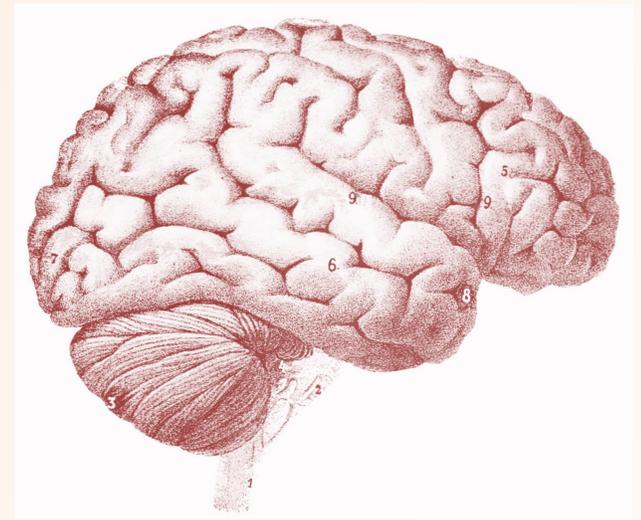

## Introduction and Aim

- Holistic Needs Assessment (HNA) is a widely used in cancer patients to determine supportive care needs
- Existing approaches to HNA includes;
    - generic HNA tools
    - cancer specific HNA tools
    - symptom assessment tools combined with problems checklists
  - Brain cancer has a unique symptom profile which limits the usability of generic cancer HNA tools
  - The aim of this study was to identify brain specific patient reported outcome measures and investigate the potential of these for HNA through;
    - assessing the psychometric properties
    - assessing usability as an HNA

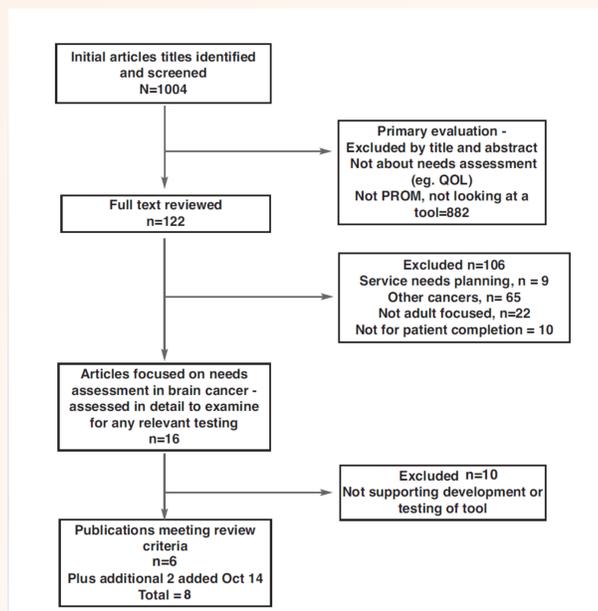

## Methods

- We searched four databases; Medline, CINAHL, BNI and Psychinfo
- We sought studies which reported the development of tools developed for use in a clinical setting in brain cancer patients, which assessed more than one domain of need.
- Inclusion and exclusion criteria - no date limit, published in English
- After review, eight studies which reported the development of four tools fulfilled our inclusion criteria
- COSMIN criteria, which have been developed through consultation with 57 experts, were used to assess the psychometric properties of the tools

## Search Strategy Flow Chart

## Results

- This review reported the development of four tools.
- Two symptom assessment tools
- MD Anderson Symptom Inventory – Brain Tumor Module (MDASI-BT)
  - National Comprehensive Cancer Network/Functional Assessment of Cancer Therapy-Brain Symptom Index (NFbrSI-24),
- Two HNA tools
- The Supportive Care Needs Survey 34 plus brain subscale (SCNS34-BS)
  - Brain Patient Concern Inventory (PCI)
- MDASI-BT demonstrated evidence of good psychometric properties and the NFbrSI-24 fair psychometric properties but both would need further development to be used in HNA
  - Brain-PCI and SCNS34-BS lacked evidence of psychometric testing with the Brain-PCI scoring better on HNA criteria

## Conclusion

While some progress has been made in the development of tools, the results indicate that no tools are adequate. Options for development include:

- additional psychometric testing for the Brain PCI
- development of a problem checklist in conjunction with the MDASI-BT

## Tools Reviewed

Tool	Purpose	Domains	N of items	Response options	Recall period
Brain PCI	HNA Clinical use	5 domains and options for referral and questions	58 plus 4 free text questions	Tick box to 'issues that have been a concern'	'recently'
MDASI-BT	SYMPTOM Clinical use and Research	Six domains	29	Scaling – A 11 point Likert scales (presence and severity) and 11 point Likert scale (level of interference)	Last 24 hours
NFbrSI-24	SYMPTOM Clinical use and Research	three subscales; disease related symptoms (physical and emotional), treatment side effects and functional/wellbeing.	24	Scaling - A five-point intensity scale based on 'how it applies to you' from 'not at all' to 'very much'	last 7 days
HNA	HNA Clinical use	<b>Format</b> - Brain specific 'add on' questionnaire to SCNS34, which has five domains . The brain subscale has no domains	50	Scaling - Five categorical responses, ranging from high need to no need.	Last month
