

## Making the shift to sustainable transport in Scotland

### Abstract:

Transport sector decarbonisation is a Scottish Government policy aim. Recent legislation and funding announcements are beginning a shift away from support for habitual car use. Sustainable transport is augmented by co-benefits of active travel itself through improvements in air quality, safety, and benefits across other sectors. At a workshop, attendees identified the need for further actions including closing down the roads programme and shifting funding to sustainable transport, reducing the need for travel, and a major shift to active travel for journeys under 3km. Such actions are reflected on in the context of the current coronavirus.

**Keywords: co-benefit; Scottish transport; active travel; sustainable travel**

### Introduction

In this think-piece we discuss the current challenges of decarbonising the Scottish transport system and highlight innovative approaches to encourage sustainable travel that have the potential to bring multiple health, social and environmental co-benefits. While this paper focusses on the Scottish context, globally, we collectively face the same issues: of how to reduce the carbon footprint of transport systems and the related blight of air pollution; and, of how to achieve health and social benefits through more sustainable methods of travel. Thus, the lessons arising from good practice and critical thinking in Scotland have relevance for other nations.

The paper draws upon a Transport & Health workshop, 'Articulating the co-benefits to key stakeholders', held in Glasgow on 22nd October 2019 convened by the Glasgow Centre for Population Health and the Transport Research Institute of Edinburgh Napier University. Its main purpose was, firstly, to explore the health, social and environmental co-benefits arising from moving to a more sustainable transport system and, secondly, to generate ideas about how to enable such a shift. Forty-three knowledgeable and experienced professionals participated, many working in strategic positions, including senior planners from Transport Scotland, local authorities and the National Health Service (NHS), academics, sustainable transport campaigners, public health practitioners, a lead politician and Scotland's Active Nation Commissioner. The workshop was structured around four keynote talks (by two senior policy makers, an academic and a public health specialist), interspersed with two workshop discussions; the first focussed on how to make the case for the co-benefits of sustainable transport and the second on identifying the key challenges and

1 solutions to transforming our urban transport systems. Notes were compiled from the discussions of  
2 five workshop groups and analysed thematically (Glasgow Centre for Population Health 2020).  
3

4 We will discuss the ideas generated by workshop delegates later in the paper. Firstly, we discuss the  
5 Scottish policy context in relation to sustainable travel, climate change, health and now Covid-19.  
6  
7 Secondly, we outline the challenges of making the shift away from the current car-dominated  
8 transport system to one built around sustainable transport and suggest practical ways to achieve  
9 progress, moving beyond policy rhetoric to action.  
10  
11  
12

13  
14  
15 Finally, to be clear from the outset, we define a sustainable transport system as one that prioritises  
16 low carbon transport choices and comprises multiple modes, including walking, cycling, public  
17 transport, and bike, wheeling, and car sharing. A sustainable transport system minimises negative  
18 social, environmental and climate impacts and relegates private car use to a minority rather than a  
19 majority of trips. By active travel, we mean travel that requires physical effort, principally walking,  
20 cycling and wheeling.

25  
26

### 27 **Policy context**

28 This paper focuses on Scottish policy in a country of 5.4 million people within the United Kingdom,  
29 which has devolved government including most aspects of transport. The Transport (Scotland) Act  
30 2019 passed in November 2019 required a new national transport strategy, provided for the  
31 introduction of low emission zones, gave local transport authorities new powers over the operation  
32 of local bus services, prohibited double-parking and parking on pavements and gave local authorities  
33 powers to introduce a workplace parking levy (Scottish Parliament 2019a). The new National  
34 Transport Strategy (NTS2) has the vision of creating “a sustainable, inclusive and accessible transport  
35 system, helping deliver a healthier, fairer and more prosperous Scotland for communities,  
36 businesses and visitors” (Transport Scotland 2020a). The Strategy highlights the importance of  
37 promoting active travel to improve health and wellbeing, to reduce inequalities and to contribute to  
38 action to address climate change.

42  
43  
44  
45  
46  
47  
48  
49

50 The Scottish Government has previously committed to increasing active travel throughout the  
51 country in the Long-Term Active Travel Vision (Transport Scotland 2014) and Cycling Action Plan for  
52 Scotland (Transport Scotland 2017). Furthermore, funding for active travel has increased from £39  
53 million in 2017-2018 to £80 million in 2018-2019, and with a further increase to £100million in  
54 2020/21 committed to in the latest Scottish government budget (Scottish Government 2020). This  
55 equates to £18.30 per head of population, more than double the committed spend per head for  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 active travel in England (House of Commons Library 2020) and 40% higher than the equivalent figure  
2 for Wales (Drakeford 2018).<sup>1</sup> By way of comparison the Dutch Government spent about £22 per  
3 head of population in 2010, had done so for decades (European Cyclists Federation 2015) and  
4 continue to do so. The latest Scottish Government budget also commits to investment of over £500  
5 million in bus priority infrastructure to improve bus journey times and raise bus usage. A further  
6 addition has been a commitment to free bus travel for under 19s (Scottish Government 2020).  
7  
8  
9

10  
11 Another major driver for change is the Scottish Government's strong, and internationally recognised,  
12 commitment to reducing carbon emissions. The latest Climate Change Act targets Scotland reaching  
13 net-zero emissions by 2045 and a 75% reduction by 2030 (Scottish Parliament 2019b). This  
14 commitment has been followed by Scotland's two largest cities, Glasgow and Edinburgh, committing  
15 to achieving carbon neutrality by 2030 (Glasgow City Council 2019, City of Edinburgh Council 2019a).  
16  
17  
18  
19  
20  
21

22 Various health-related policies emphasise the need to shift to more active and less polluting modes  
23 of transport. The Cleaner Air for Scotland (CAFS) strategy sets out how the Scottish Government and  
24 its partner organisations will reduce air pollution to protect human health and fulfil Scotland's legal  
25 responsibilities in relation to quality, and has the ambition that Scotland will "have the best air  
26 quality in Europe" (Scottish Government 2015). As a consequence of failing to meet air quality  
27 strategy objectives, Scotland is now committed to introducing low emission zones (LEZs) in its four  
28 largest cities. A recent review of CAFS pointed to a need for more "focus on inter-related  
29 interventions including improved transport infrastructure that encourages higher levels of active  
30 travel; improved access to accessible, affordable and better quality public transport...and greater  
31 encouragement to adopt less polluting private personal transport (e.g. low and zero emission  
32 vehicles) (Scottish Government 2019a)."

39  
40  
41  
42

43 Scotland has an unenviable record of poor health and premature mortality compared to other  
44 western European countries (McCartney *et al.* 2011), and only two thirds of adults (66%) meet the  
45 guidelines for Moderate or Vigorous Physical Activity and 65% are overweight or obese (Scottish  
46 Government 2019b). Active travel is recognised as having a role in both increasing levels of physical  
47 activity (Scottish Government 2018a) and addressing overweight and obesity (Scottish Government  
48 2018b).  
49

<sup>1</sup> This comparison is based on commitments made prior to Covid-19, the impact of which may change future  
60 budgets significantly  
61  
62  
63  
64  
65

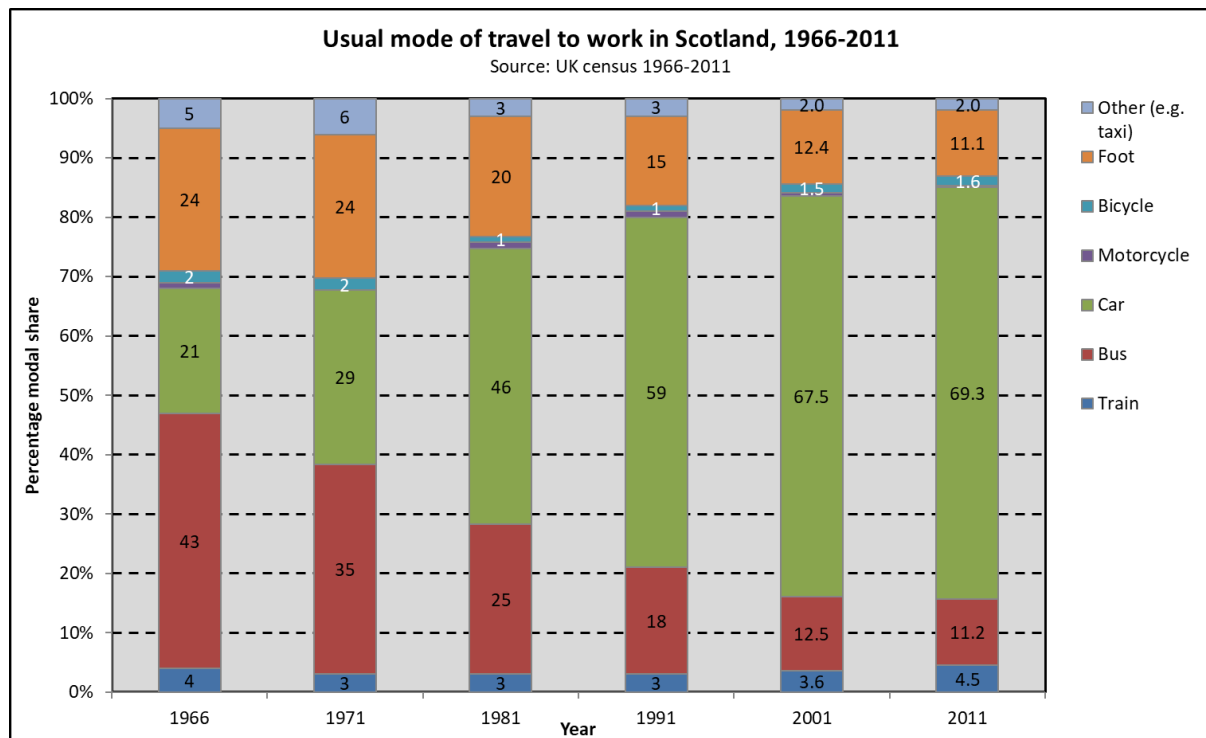

1 Goals and underpinned by a recognition that the environment around us can positively (or  
2 negatively) influence our wellbeing and outcomes for communities (Scottish Government 2019c).  
3 Placemaking has a growing role in planning and wellbeing policy, supporting the government's  
4 wellbeing framework, the National Performance Framework. How people relate to a place affects  
5 how they move around and use their home neighbourhood. When successfully implemented,  
6 placemaking can help encourage sustainable travel, improve air quality, support green infrastructure  
7 and mitigate climate change.  
8  
9

## 13 **Challenges to a shift to more sustainable modes**

### 15 *Car use*

17 The first and most fundamental challenge to shifting to more sustainable modes of travel is the  
18 ubiquity of the car. While commuting journeys only represent one type of journey, the growth in car  
19 use can be illustrated by the commuting trends of employed adults over a 45-year period in Scotland  
20 (1966-2011) using the UK Census (Figure 1). In this period, the proportion of car commuters trebled,  
21 rising to 69% in 2011. At the same time, commuting on foot and by bus reduced significantly, each  
22 accounting for only 11% of commuters by 2011, while train use rose marginally to account for 4.5%  
23 of commuters by 2011. Cycle commuting remained low at 1.6% of commuters in 2011 (Whyte and  
24 Waugh 2015, p16). More recent data show that car use, as measured by road distances driven  
25 (across all types of journey) or licensed motor vehicles on the road, continues to rise, while bus  
26 passengers continue to decline (Transport Scotland 2019).

Figure 1

### Carbon emissions

The continued rises in private motorised transport and distances driven help explain why, despite overall reductions in carbon emissions in Scotland (by 2017 total emissions were 46.8% below the 1990 baseline of 76.3 MtCO<sub>2</sub>e), transport emissions, including international aviation and shipping, have risen and were 0.4% above the 1990 baseline year (Scottish Government 2019d). Transport is Scotland's largest greenhouse gas emitting sector, making up 37% of all Scottish emissions and road transport accounts for the largest share of this (68% of all transport emissions) (Transport Scotland 2019). Car emissions, which account for 40% of all transport emissions, have been rising since 2013 and in 2017 were 1.7% above the 1990 baseline. Additionally, emissions from new vehicles, which had been falling, started to rise in 2017. This is thought to be due, at least in part, to an increase in the proportion of larger new cars (SUVs) being registered with higher emissions (Scottish Government, 2019d).

### Low emission vehicles

It is also relevant to note that while the number of Electric and Hybrid Electric motor vehicles in Scotland has increased in recent years (to 37,000 in 2018) these vehicles still account for less than 1.2% of all licensed vehicles (Transport Scotland 2019); in 2018, a total of 10,300 new electric and hybrid electric vehicles were registered in Scotland compared to an estimated 5,700 e-bike sales (Bicycle Association of Great Britain 2020).

1            *Investment*

2  
3            The Scottish Government remains committed to increasing road network capacity, which runs  
4  
5            counter to the otherwise strong policy on addressing climate change, and is despite  
6  
7            recommendations to end increases in highway capacity made by Government convened  
8  
9            independent bodies (Scottish Government, 2019a; Infrastructure Commission for Scotland, 2020).  
10           While the budget for active travel has increased substantially, the £100 million allocation in 2020/21  
11  
12           still accounts for only 3.3% of the total transport budget. Many organisations have campaigned for  
13  
14           10% of the transport budget to be allocated to active travel (e.g. Association of Directors of Public  
15  
16           Health 2008) in order to bring Scotland’s spending in line with countries with high levels of cycling  
17  
18           like the Netherlands and Denmark.

19  
20  
21           *Operational barriers*

22           There are also operational barriers to making progress. The process of consulting the public on new  
23  
24           infrastructure or speed restrictions and the need to put in place Traffic Regulation orders (TROs) can  
25  
26           slow progress. In relation to creating new active travel infrastructure, development can be patchy  
27  
28           with progress mainly occurring in large urban centres rather than in small rural authorities (which  
29  
30           have less funds in the first place to allocate). Even where investment is happening there is  
31  
32           widespread acknowledgement that safe active travel routes, particularly for cycling, are limited,  
33  
34           disconnected, and that it will take years to create a coherent joined-up network (Connectivity  
35  
36           Commission 2019).

37  
38  
39           *Public transport*

40           The availability, accessibility and affordability of public transport, particularly buses, varies widely  
41  
42           across Scotland, creating barriers to use that impact socially and economically. The more limited  
43  
44           availability and frequency of public transport in rural areas and the greater distances to travel tend  
45  
46           to lead to a greater reliance on driving in rural households. There is acknowledgement that much  
47  
48           more needs to be done to integrate transport services and ticketing to facilitate multi-modal  
49  
50           journeys (Connectivity Commission 2019).

51  
52           *Inequalities*

53  
54           There are many elements of the way the current transport system operates that lead to inequalities.  
55  
56           Public transport is particularly important for households on low income but in many areas of social  
57  
58           deprivation public transport options can be limited and relatively expensive (Transport Scotland  
59  
60           2020). This is one of the factors associated with ‘forced car ownership’ among families in financial  
61

difficulties, where having a car is seen as a requirement to access employment and access to public transport is restricted due to quality, frequency and reliability issues (Curl *et al.* 2018).

Public transport timetables are built around a 'nine-to-five' working pattern, and radial (i.e. along main corridors to town and cities but not orbital for cross city journeys) and therefore do not necessarily suit those in unpaid care work and part-time employment, who are predominantly women. Feelings of being unsafe and fear of violence particularly affect women and can be an additional barrier to public transport use especially at night. Disabled people face multiple barriers to travel, including not being able to access public transport vehicles and interchanges between modes, while people in rural areas find accessing services less convenient and satisfaction with public transport is much lower in accessible rural areas.

Cycling currently is skewed toward more affluent demographic groups and to men in particular, but as active travel spending increases, the design and targeting of this investment needs to be carefully planned to ensure the benefits of increased levels of active travel are shared across the population, otherwise inequalities will remain or widen.

### **Co-benefits of active travel**

The concept of co-benefits was introduced at the workshop. Evidence was presented of how interventions to reduce transport-related carbon emissions could have wider 'co-benefits' for health, social cohesion and quality of life. Co-benefits are an outcome of climate-friendly policies, so reducing carbon-based energy in the transport sector often leads to improvements in human health. Walking and cycle commuting have been associated with a lower risk of CVD and cycle commuting is also associated with lower cancer risk and lower mortality (Celis-Morales *et al.* 2017), while switching to more active modes of commuting (from private motor transport) has been associated with significant reductions in BMI (Martin *et al.* 2015). Walking and cycling have been shown to have population-level health benefits even after adjusting for other physical activity (Kelly *et al.* 2014).

Beyond increased levels of walking and cycling and consequent improvements in cardio-vascular and mental health there may also be improvements in respiratory health as a result of reductions in motorised traffic and congestion. Further benefits discussed which span other sectors included the issue of increased academic attainment by school children who are more physically active, the biggest opportunity for which is active travel on the school journey.

64  
65

As noted earlier, we see positive rhetoric about the need to shift to more sustainable transport modes, and increasing recognition of the synergies between different policy areas and their potential environmental, health and social co-benefits. Transport is now a key driver for other policies. The new national transport strategy (NTS2) endorses the sustainable transport hierarchy, while the new Transport Bill has good elements (new powers for local authorities over the operation of bus services and the opportunity to introduce a Workplace Parking Levy<sup>2</sup>). National investment in bus prioritisation and active travel is rising.

In Scotland's two largest cities<sup>3</sup>, Edinburgh (population= 525,000 in 2019) and Glasgow (population= 633,000 in 2019), there is evidence of increasing commitment to, and investment in, active and sustainable travel. Since 2012/13, Edinburgh City Council has increased its financial commitment to active travel; currently 10% of the city's transport budget is spent on cycling. Even prior to this commitment, there were signs of promising modal shifts in commuting patterns in the city. Between the 2001 and 2011 Censuses, Edinburgh (uniquely among Scottish local authorities) showed an increase in the individual modal shares of walking, cycling, bus and train commutes, while car driving and being a passenger declined; indeed a higher proportion of people in the city walked, cycled and took the bus to work than anywhere else in Scotland (Whyte and Waugh, 2015, p54). More recently, there is evidence that Edinburgh's city wide 20mph limit is reducing average vehicle speed (Nightingale and Jepson, 2019), creating safer streets and encouraging more people to walk and cycle (City of Edinburgh Council, 2019b). Looking ahead, Edinburgh's city centre transformation strategy commits to deliver £420 million of benefits over a 25-year period investing in improved public spaces, inclusive access and prioritisation of active travel and of public transport (City of Edinburgh Council, 2019c).

In Glasgow, similar developments are underway. A network of radial cycling routes into the city (city cycleways) is being built, a low emission zone is being phased in and the 'Avenues' programme (with £115 million of City Deal funding) aims to establish principal avenues throughout the city centre to form an integrated network of continuous pedestrian and cycle priority routes. The Sauchiehall St pilot avenue, completed in June 2019, includes: an avenue of trees, segregated cycle lanes, increased pedestrian/cycle space, continuous footways and reduced street clutter, free Wi-Fi and intelligent street lighting (Glasgow City Council 2018). In addition, the Council has committed to

---

<sup>2</sup> A Workplace Parking Levy is a charge on employers who provide workplace parking, a type of congestion charging scheme. See <https://www.nottinghamcity.gov.uk/information-for-residents/transport-parking-and-streets/parking-and-permits/workplace-parking-levy>

<sup>3</sup> Greater Glasgow's population together with the equivalent population for Edinburgh is 2,029,000 i.e. roughly 37.5% of Scotland's population.

1 introducing a 20mph limit across the whole council area and to spending at least 10% of its transport  
2 budget on active travel.  
3

4  
5 Some employers have started endorsing more flexible work practices including home working. The  
6 Coronavirus pandemic looks likely to accelerate these changes, driven by the necessity for many to  
7 work from home and the swift adoption of on-line meetings (Transport Scotland 2020c).  
8

9  
10 Nevertheless, we need to be aware that for people employed in shift work, in factories and on zero-  
11 hours contracts such changes are likely not to be available. Additionally, home working, while  
12 reducing the need to travel, risks social isolation and reduced physical activity.  
13  
14

15  
16  
17 Mitigation of Covid-19 has necessitated social distancing – in the UK people are required to stay 2  
18 metres apart – and has led to issues of over-crowded pavements and paths where people are  
19 walking or cycling for exercise or work. This has prompted Transport Scotland to provide special  
20 funding for temporary infrastructure, via the Spaces for People programme delivered by Sustrans  
21 (Sustrans 2020), to ensure social distancing is possible. The scheme is funding local 20mph speed  
22 restrictions, road closures to motor vehicles and the building of temporary segregated cycle and  
23 walking paths on roadways. While currently temporary, these changes can help accelerate  
24 investment in the active travel infrastructure needed to support more sustainable travel in the  
25 longer term. Such changes may also become a requirement to sustain social distancing over a longer  
26 period and to ‘future proof’ against the possibility of future pandemics.  
27

34  
35

### 36 **What else needs to happen?**

37  
38 Returning to our October workshop and the context of the climate emergency, a range of ideas for  
39 how to make progress toward active and sustainable travel were suggested by delegates, some  
40 strategic, some practical and some radical.  
41  
42  
43  
44

### 45 *Leadership and budget shifts*

46 Individual and organisational leadership across all sectors, political will and sustained follow-through  
47 were identified as key requirements for change to be delivered. A fundamental shift in the transport  
48 budget away from private motor vehicle use and roads towards active and sustainable transport is  
49 needed. To this end one suggestion, was to end the roads programme in the next five years and use  
50 the budget purely for maintenance with money saved going to active and sustainable transport;  
51 echoing a suggestion made in the review of the Cleaner Air For Scotland strategy, as noted earlier  
52 (Scottish Government 2019a).  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

### *Disincentivising car use and encouraging public and active transport*

1  
2 Many ways of reducing car use were discussed; for example, making car journeys the most  
3 expensive option for travel, highlighting the availability of public transport and active travel routes,  
4 incentivising business to encourage staff to car share, integrating car hire with public transport and  
5 more radically and making public transport free for all. This latter suggestion is coming closer to  
6 reality in Scotland with the recent budget agreement to provide free bus travel to under 19s  
7 (Scottish Government 2020), a right which is already in place for anyone aged 60 years or older.  
8 Delegates also focused on parking, suggesting closing car parks, enhanced parking restrictions and  
9 rationing the amount of car park space available.  
10

### *Infrastructure and public transport improvements*

11  
12 We need to improve infrastructure, normalise active travel and increase public transport use,  
13 particularly the use of buses. Different models of bus ownership were favoured with a return of bus  
14 services to public ownership being a popular suggestion. Public transport providers must work  
15 together to provide an integrated transport network, integrated ticketing and affordable prices that  
16 compare favourably with the equivalent costs of car travel. However, as a result of the Coronavirus  
17 pandemic, a majority of the public in Scotland are concerned about contracting or spreading the  
18 virus while on public transport and many have indicated they will avoid public transport in future  
19 (Transport Scotland 2020c). This crisis presents very real challenges for public transport providers  
20 but is also an opportunity to redesign public transport to provide safer, less crowded, more pleasant  
21 public transport options integrated with active travel.

### *Key settings*

38  
39 There are key settings where much more progress is needed e.g. education, National Health Service  
40 facilities. Within the public sector three specific ideas were advanced: moving to shared work-places  
41 across the public sector to reduce the need for travel and encourage collaborative working; sharing  
42 pool cars and pool bikes across the public sector; and reducing public sector reimbursement for car  
43 travel. Around schools there was a suggestion that cars should be banned within two miles of  
44 schools and that walking 'buses' and organised bike rides to school should be made compulsory.  
45 Some Scottish local authorities are already piloting school street closures before and directly after  
46 school hours to enable safer active travel to school, to reduce congestion and to tackle poor air  
47 quality (Davis 2020).

1 We need public information campaigns with tiers of messaging; reflecting individual benefits of  
2 changes (e.g. saving money, convenience) as well as societal benefits. Climate change messages  
3 need to be strong e.g. don't drive if the journey is less than 3km and build on the fact that forty-one  
4 percent of all trips in Scotland in 2018 were under 3km and noting the potential for behaviour  
5 change because for journeys up to 1km 34% were made by car or van (Transport Scotland 2019).

9

## 10 **Limitations**

11 We acknowledge that the group of participants invited to this workshop represented advocates for a  
12 shift to sustainable transport and a wider dialogue is needed with other organisations and groups, so  
13 that a range of different views, which may not all be so supportive, can be represented. In addition,  
14 the workshop discussions took place over a morning and necessarily could not cover all the topics  
15 relevant to shifting to a sustainable transport system. For example, one such omission was land-use  
16 policy, which was not discussed explicitly but can have an important impact on car use and distances  
17 travelled.

25

## 26 **Conclusions**

27 The climate emergency can be a lever for changing how we travel and climate change targets will  
28 fundamentally change how all organisations operate. The changes necessitated by Covid-19 provide  
29 further impetus to adapt how we work, to reduce the necessity to travel and to use less carbon  
30 intensive forms of travel. The Spaces for People programme funding temporary active travel  
31 infrastructure in Scotland is a good example of what can be achieved in a short space of time  
32 (Sustrans 2020).  
33  
34  
35  
36  
37  
38  
39

40 Nationally, the Scottish Government needs to back up its strong policy commitments toward a low  
41 carbon transport system with significantly increased investment in sustainable transport while  
42 reducing its roads budget. Local and regional transport authorities need to be given the resources to  
43 drive this investment, and the flexibility to adapt transport systems in the differing urban and rural  
44 environments across Scotland. This will require leadership at all levels and also funds.  
45  
46  
47  
48  
49  
50

51 There is strong evidence that whole town/city interventions which may contain many intervention  
52 types are more effective in creating a 'whole system' change than localised single mode  
53 interventions, and that this success has been achieved in the UK (Department for Transport, 2017).  
54 Additionally, it is important to integrate 'hard' and 'soft' transport measures, for example combining  
55  
56

65

1 new services or infrastructure with appropriate messaging and incentives to encourage use (Cairns  
2 *et al.* 2016).

3  
4  
5 This needs to be a just transition. Too many people suffer transport inequalities currently, not least  
6 women and ethnic minorities. Investment should support vulnerable population groups and  
7 communities most in need; without this approach these inequalities will remain or widen.  
8  
9

10  
11  
12 However, we need to move swiftly from policy to action. Targets for reaching net-zero emissions in  
13 Glasgow and Edinburgh by 2030 are already challenging; we have to accelerate progress toward a  
14 low carbon transport system or risk setting our sights on increasingly unattainable goals.  
15  
16  
17

18  
19 As a coda, as was mentioned at the workshop, the challenge posed by climate change may,  
20 ironically, provide the biggest opportunity yet to improve population health.

## **Making the shift to sustainable transport in Scotland**

**Adrian L Davis, Transport Research Institute, Edinburgh Napier University, 10 Colinton Road, Edinburgh EH10 4DT**  
**Bruce Whyte, Glasgow Centre for Population Health, Third Floor, Olympia Building, Bridgeton Cross, Glasgow G40 2QH**

### **Abstract:**

Transport sector decarbonisation is a Scottish Government policy aim. Recent legislation and funding announcements are beginning a shift away from support for habitual car use. Sustainable transport is augmented by co-benefits of active travel itself through improvements in air quality, safety, and benefits across other sectors. At a workshop, attendees identified the need for further actions including closing down the roads programme and shifting funding to sustainable transport, reducing the need for travel, and a major shift to active travel for journeys under 3km. Such actions are reflected on in the context of the current coronavirus.

**Keywords: co-benefit; Scottish transport; active travel; sustainable travel**

### **Introduction**

In this think-piece we discuss the current challenges of decarbonising the Scottish transport system and highlight innovative approaches to encourage sustainable travel that have the potential to bring multiple health, social and environmental co-benefits. While this paper focusses on the Scottish context, globally, we collectively face the same issues: of how to reduce the carbon footprint of transport systems and the related blight of air pollution; and, of how to achieve health and social benefits through more sustainable methods of travel. Thus, the lessons arising from good practice and critical thinking in Scotland have relevance for other nations.

The paper draws upon a Transport & Health workshop, 'Articulating the co-benefits to key stakeholders', held in Glasgow on 22nd October 2019 convened by the Glasgow Centre for Population Health and the Transport Research Institute of Edinburgh Napier University. Its main purpose was, firstly, to explore the health, social and environmental co-benefits arising from moving to a more sustainable transport system and, secondly, to generate ideas about how to enable such a shift. Forty-three knowledgeable and experienced professionals participated, many working in strategic positions, including senior planners from Transport Scotland, local authorities and the National Health Service (NHS), academics, sustainable transport campaigners, public health practitioners, a lead politician and Scotland's Active Nation Commissioner. The workshop was structured around four keynote talks (by two senior policy makers, an academic and a public health

specialist), interspersed with two workshop discussions; the first focussed on how to make the case for the co-benefits of sustainable transport and the second on identifying the key challenges and solutions to transforming our urban transport systems. Notes were compiled from the discussions of five workshop groups and analysed thematically (Glasgow Centre for Population Health 2020).

We will discuss the ideas generated by workshop delegates later in the paper. Firstly, we discuss the Scottish policy context in relation to sustainable travel, climate change, health and now Covid-19. Secondly, we outline the challenges of making the shift away from the current car-dominated transport system to one built around sustainable transport and suggest practical ways to achieve progress, moving beyond policy rhetoric to action.

Finally, to be clear from the outset, we define a sustainable transport system as one that prioritises low carbon transport choices and comprises multiple modes, including walking, cycling, public transport, and bike, wheeling, and car sharing. A sustainable transport system minimises negative social, environmental and climate impacts and relegates private car use to a minority rather than a majority of trips. By active travel, we mean travel that requires physical effort, principally walking, cycling and wheeling.

### **Policy context**

This paper focuses on Scottish policy in a country of 5.4 million people within the United Kingdom, which has devolved government including most aspects of transport. The Transport (Scotland) Act 2019 passed in November 2019 required a new national transport strategy, provided for the introduction of low emission zones, gave local transport authorities new powers over the operation of local bus services, prohibited double-parking and parking on pavements and gave local authorities powers to introduce a workplace parking levy (Scottish Parliament 2019a). The new National Transport Strategy (NTS2) has the vision of creating “a sustainable, inclusive and accessible transport system, helping deliver a healthier, fairer and more prosperous Scotland for communities, businesses and visitors” (Transport Scotland 2020a). The Strategy highlights the importance of promoting active travel to improve health and wellbeing, to reduce inequalities and to contribute to action to address climate change.

The Scottish Government has previously committed to increasing active travel throughout the country in the Long-Term Active Travel Vision (Transport Scotland 2014) and Cycling Action Plan for Scotland (Transport Scotland 2017). Furthermore, funding for active travel has increased from £39 million in 2017-2018 to £80 million in 2018-2019, and with a further increase to £100million in

2020/21 committed to in the latest Scottish government budget (Scottish Government 2020). This equates to £18.30 per head of population, more than double the committed spend per head for active travel in England (House of Commons Library 2020) and 40% higher than the equivalent figure for Wales (Drakeford 2018).<sup>1</sup> By way of comparison the Dutch Government spent about £22 per head of population in 2010, had done so for decades (European Cyclists Federation 2015) and continue to do so. The latest Scottish Government budget also commits to investment of over £500 million in bus priority infrastructure to improve bus journey times and raise bus usage. A further addition has been a commitment to free bus travel for under 19s (Scottish Government 2020).

Another major driver for change is the Scottish Government's strong, and internationally recognised, commitment to reducing carbon emissions. The latest Climate Change Act targets Scotland reaching net-zero emissions by 2045 and a 75% reduction by 2030 (Scottish Parliament 2019b). This commitment has been followed by Scotland's two largest cities, Glasgow and Edinburgh, committing to achieving carbon neutrality by 2030 (Glasgow City Council 2019, City of Edinburgh Council 2019a).

Various health-related policies emphasise the need to shift to more active and less polluting modes of transport. The Cleaner Air for Scotland (CAFS) strategy sets out how the Scottish Government and its partner organisations will reduce air pollution to protect human health and fulfil Scotland's legal responsibilities in relation to quality, and has the ambition that Scotland will "have the best air quality in Europe" (Scottish Government 2015). As a consequence of failing to meet air quality strategy objectives, Scotland is now committed to introducing low emission zones (LEZs) in its four largest cities. A recent review of CAFS pointed to a need for more "focus on inter-related interventions including improved transport infrastructure that encourages higher levels of active travel; improved access to accessible, affordable and better quality public transport...and greater encouragement to adopt less polluting private personal transport (e.g. low and zero emission vehicles) (Scottish Government 2019a)."

Scotland has an unenviable record of poor health and premature mortality compared to other western European countries (McCartney *et al.* 2011), and only two thirds of adults (66%) meet the guidelines for Moderate or Vigorous Physical Activity and 65% are overweight or obese (Scottish Government 2019b). Active travel is recognised as having a role in both increasing levels of physical activity (Scottish Government 2018a) and addressing overweight and obesity (Scottish Government 2018b).

---

<sup>1</sup> This comparison is based on commitments made prior to Covid-19, the impact of which may change future budgets significantly

Placemaking is a linked strand of government policy, influenced by the UN Sustainable Development Goals and underpinned by a recognition that the environment around us can positively (or negatively) influence our wellbeing and outcomes for communities (Scottish Government 2019c). Placemaking has a growing role in planning and wellbeing policy, supporting the government's wellbeing framework, the National Performance Framework. How people relate to a place affects how they move around and use their home neighbourhood. When successfully implemented, placemaking can help encourage sustainable travel, improve air quality, support green infrastructure and mitigate climate change.

### **Challenges to a shift to more sustainable modes**

#### *Car use*

The first and most fundamental challenge to shifting to more sustainable modes of travel is the ubiquity of the car. While commuting journeys only represent one type of journey, the growth in car use can be illustrated by the commuting trends of employed adults over a 45-year period in Scotland (1966-2011) using the UK Census (Figure 1). In this period, the proportion of car commuters trebled, rising to 69% in 2011. At the same time, commuting on foot and by bus reduced significantly, each accounting for only 11% of commuters by 2011, while train use rose marginally to account for 4.5% of commuters by 2011. Cycle commuting remained low at 1.6% of commuters in 2011 (Whyte and Waugh 2015, p16). More recent data show that car use, as measured by road distances driven (across all types of journey) or licensed motor vehicles on the road, continues to rise, while bus passengers continue to decline (Transport Scotland 2019).

Figure 1

### Carbon emissions

The continued rises in private motorised transport and distances driven help explain why, despite overall reductions in carbon emissions in Scotland (by 2017 total emissions were 46.8% below the 1990 baseline of 76.3 MtCO<sub>2</sub>e), transport emissions, including international aviation and shipping, have risen and were 0.4% above the 1990 baseline year (Scottish Government 2019d). Transport is Scotland's largest greenhouse gas emitting sector, making up 37% of all Scottish emissions and road transport accounts for the largest share of this (68% of all transport emissions) (Transport Scotland 2019). Car emissions, which account for 40% of all transport emissions, have been rising since 2013 and in 2017 were 1.7% above the 1990 baseline. Additionally, emissions from new vehicles, which had been falling, started to rise in 2017. This is thought to be due, at least in part, to an increase in the proportion of larger new cars (SUVs) being registered with higher emissions (Scottish Government, 2019d).

### Low emission vehicles

It is also relevant to note that while the number of Electric and Hybrid Electric motor vehicles in Scotland has increased in recent years (to 37,000 in 2018) these vehicles still account for less than 1.2% of all licensed vehicles (Transport Scotland 2019); in 2018, a total of 10,300 new electric and hybrid electric vehicles were registered in Scotland compared to an estimated 5,700 e-bike sales (Bicycle Association of Great Britain 2020).

### *Investment*

The Scottish Government remains committed to increasing road network capacity, which runs counter to the otherwise strong policy on addressing climate change, and is despite recommendations to end increases in highway capacity made by Government convened independent bodies (Scottish Government, 2019a; Infrastructure Commission for Scotland, 2020). While the budget for active travel has increased substantially, the £100 million allocation in 2020/21 still accounts for only 3.3% of the total transport budget. Many organisations have campaigned for 10% of the transport budget to be allocated to active travel (e.g. Association of Directors of Public Health 2008) in order to bring Scotland's spending in line with countries with high levels of cycling like the Netherlands and Denmark.

### *Operational barriers*

There are also operational barriers to making progress. The process of consulting the public on new infrastructure or speed restrictions and the need to put in place Traffic Regulation orders (TROs) can slow progress. In relation to creating new active travel infrastructure, development can be patchy with progress mainly occurring in large urban centres rather than in small rural authorities (which have less funds in the first place to allocate). Even where investment is happening there is widespread acknowledgement that safe active travel routes, particularly for cycling, are limited, disconnected, and that it will take years to create a coherent joined-up network (Connectivity Commission 2019).

### *Public transport*

The availability, accessibility and affordability of public transport, particularly buses, varies widely across Scotland, creating barriers to use that impact socially and economically. The more limited availability and frequency of public transport in rural areas and the greater distances to travel tend to lead to a greater reliance on driving in rural households. There is acknowledgement that much more needs to be done to integrate transport services and ticketing to facilitate multi-modal journeys (Connectivity Commission 2019).

### *Inequalities*

There are many elements of the way the current transport system operates that lead to inequalities. Public transport is particularly important for households on low income but in many areas of social deprivation public transport options can be limited and relatively expensive (Transport Scotland 2020). This is one of the factors associated with 'forced car ownership' among families in financial

difficulties, where having a car is seen as a requirement to access employment and access to public transport is restricted due to quality, frequency and reliability issues (Curl *et al.* 2018).

Public transport timetables are built around a 'nine-to-five' working pattern, and radial (i.e. along main corridors to town and cities but not orbital for cross city journeys) and therefore do not necessarily suit those in unpaid care work and part-time employment, who are predominantly women. Feelings of being unsafe and fear of violence particularly affect women and can be an additional barrier to public transport use especially at night. Disabled people face multiple barriers to travel, including not being able to access public transport vehicles and interchanges between modes, while people in rural areas find accessing services less convenient and satisfaction with public transport is much lower in accessible rural areas.

Cycling currently is skewed toward more affluent demographic groups and to men in particular, but as active travel spending increases, the design and targeting of this investment needs to be carefully planned to ensure the benefits of increased levels of active travel are shared across the population, otherwise inequalities will remain or widen.

### **Co-benefits of active travel**

The concept of co-benefits was introduced at the workshop. Evidence was presented of how interventions to reduce transport-related carbon emissions could have wider 'co-benefits' for health, social cohesion and quality of life. Co-benefits are an outcome of climate-friendly policies, so reducing carbon-based energy in the transport sector often leads to improvements in human health. Walking and cycle commuting have been associated with a lower risk of CVD and cycle commuting is also associated with lower cancer risk and lower mortality (Celis-Morales *et al.* 2017), while switching to more active modes of commuting (from private motor transport) has been associated with significant reductions in BMI (Martin *et al.* 2015). Walking and cycling have been shown to have population-level health benefits even after adjusting for other physical activity (Kelly *et al.* 2014).

Beyond increased levels of walking and cycling and consequent improvements in cardio-vascular and mental health there may also be improvements in respiratory health as a result of reductions in motorised traffic and congestion. Further benefits discussed which span other sectors included the issue of increased academic attainment by school children who are more physically active, the biggest opportunity for which is active travel on the school journey.

### **Signs of progress**

As noted earlier, we see positive rhetoric about the need to shift to more sustainable transport modes, and increasing recognition of the synergies between different policy areas and their potential environmental, health and social co-benefits. Transport is now a key driver for other policies. The new national transport strategy (NTS2) endorses the sustainable transport hierarchy, while the new Transport Bill has good elements (new powers for local authorities over the operation of bus services and the opportunity to introduce a Workplace Parking Levy<sup>2</sup>). National investment in bus prioritisation and active travel is rising.

In Scotland's two largest cities<sup>3</sup>, Edinburgh (population= 525,000 in 2019) and Glasgow (population= 633,000 in 2019), there is evidence of increasing commitment to, and investment in, active and sustainable travel. Since 2012/13, Edinburgh City Council has increased its financial commitment to active travel; currently 10% of the city's transport budget is spent on cycling. Even prior to this commitment, there were signs of promising modal shifts in commuting patterns in the city. Between the 2001 and 2011 Censuses, Edinburgh (uniquely among Scottish local authorities) showed an increase in the individual modal shares of walking, cycling, bus and train commutes, while car driving and being a passenger declined; indeed a higher proportion of people in the city walked, cycled and took the bus to work than anywhere else in Scotland (Whyte and Waugh, 2015, p54). More recently, there is evidence that Edinburgh's city wide 20mph limit is reducing average vehicle speed (Nightingale and Jepson, 2019), creating safer streets and encouraging more people to walk and cycle (City of Edinburgh Council, 2019b). Looking ahead, Edinburgh's city centre transformation strategy commits to deliver £420 million of benefits over a 25-year period investing in improved public spaces, inclusive access and prioritisation of active travel and of public transport (City of Edinburgh Council, 2019c).

In Glasgow, similar developments are underway. A network of radial cycling routes into the city (city cycleways) is being built, a low emission zone is being phased in and the 'Avenues' programme (with £115 million of City Deal funding) aims to establish principal avenues throughout the city centre to form an integrated network of continuous pedestrian and cycle priority routes. The Sauchiehall St pilot avenue, completed in June 2019, includes: an avenue of trees, segregated cycle lanes, increased pedestrian/cycle space, continuous footways and reduced street clutter, free Wi-Fi and intelligent street lighting (Glasgow City Council 2018). In addition, the Council has committed to

---

<sup>2</sup> A Workplace Parking Levy is a charge on employers who provide workplace parking, a type of congestion charging scheme. See <https://www.nottinghamcity.gov.uk/information-for-residents/transport-parking-and-streets/parking-and-permits/workplace-parking-levy>

<sup>3</sup> Greater Glasgow's population together with the equivalent population for Edinburgh is 2,029,000 i.e. roughly 37.5% of Scotland's population.

introducing a 20mph limit across the whole council area and to spending at least 10% of its transport budget on active travel.

Some employers have started endorsing more flexible work practices including home working. The Coronavirus pandemic looks likely to accelerate these changes, driven by the necessity for many to work from home and the swift adoption of on-line meetings (Transport Scotland 2020c). Nevertheless, we need to be aware that for people employed in shift work, in factories and on zero-hours contracts such changes are likely not to be available. Additionally, home working, while reducing the need to travel, risks social isolation and reduced physical activity.

Mitigation of Covid-19 has necessitated social distancing – in the UK people are required to stay 2 metres apart – and has led to issues of over-crowded pavements and paths where people are walking or cycling for exercise or work. This has prompted Transport Scotland to provide special funding for temporary infrastructure, via the Spaces for People programme delivered by Sustrans (Sustrans 2020), to ensure social distancing is possible. The scheme is funding local 20mph speed restrictions, road closures to motor vehicles and the building of temporary segregated cycle and walking paths on roadways. While currently temporary, these changes can help accelerate investment in the active travel infrastructure needed to support more sustainable travel in the longer term. Such changes may also become a requirement to sustain social distancing over a longer period and to ‘future proof’ against the possibility of future pandemics.

### **What else needs to happen?**

Returning to our October workshop and the context of the climate emergency, a range of ideas for how to make progress toward active and sustainable travel were suggested by delegates, some strategic, some practical and some radical.

#### *Leadership and budget shifts*

Individual and organisational leadership across all sectors, political will and sustained follow-through were identified as key requirements for change to be delivered. A fundamental shift in the transport budget away from private motor vehicle use and roads towards active and sustainable transport is needed. To this end one suggestion, was to end the roads programme in the next five years and use the budget purely for maintenance with money saved going to active and sustainable transport; echoing a suggestion made in the review of the Cleaner Air For Scotland strategy, as noted earlier (Scottish Government 2019a).

### *Disincentivising car use and encouraging public and active transport*

Many ways of reducing car use were discussed; for example, making car journeys the most expensive option for travel, highlighting the availability of public transport and active travel routes, incentivising business to encourage staff to car share, integrating car hire with public transport and more radically and making public transport free for all. This latter suggestion is coming closer to reality in Scotland with the recent budget agreement to provide free bus travel to under 19s (Scottish Government 2020), a right which is already in place for anyone aged 60 years or older. Delegates also focused on parking, suggesting closing car parks, enhanced parking restrictions and rationing the amount of car park space available.

### *Infrastructure and public transport improvements*

We need to improve infrastructure, normalise active travel and increase public transport use, particularly the use of buses. Different models of bus ownership were favoured with a return of bus services to public ownership being a popular suggestion. Public transport providers must work together to provide an integrated transport network, integrated ticketing and affordable prices that compare favourably with the equivalent costs of car travel. However, as a result of the Coronavirus pandemic, a majority of the public in Scotland are concerned about contracting or spreading the virus while on public transport and many have indicated they will avoid public transport in future (Transport Scotland 2020c). This crisis presents very real challenges for public transport providers but is also an opportunity to redesign public transport to provide safer, less crowded, more pleasant public transport options integrated with active travel.

### *Key settings*

There are key settings where much more progress is needed e.g. education, National Health Service facilities. Within the public sector three specific ideas were advanced: moving to shared work-places across the public sector to reduce the need for travel and encourage collaborative working; sharing pool cars and pool bikes across the public sector; and reducing public sector reimbursement for car travel. Around schools there was a suggestion that cars should be banned within two miles of schools and that walking 'buses' and organised bike rides to school should be made compulsory. Some Scottish local authorities are already piloting school street closures before and directly after school hours to enable safer active travel to school, to reduce congestion and to tackle poor air quality (Davis 2020).

### *Communication*

We need public information campaigns with tiers of messaging; reflecting individual benefits of changes (e.g. saving money, convenience) as well as societal benefits. Climate change messages need to be strong e.g. don't drive if the journey is less than 3km and build on the fact that forty-one percent of all trips in Scotland in 2018 were under 3km and noting the potential for behaviour change because for journeys up to 1km 34% were made by car or van (Transport Scotland 2019).

### **Limitations**

We acknowledge that the group of participants invited to this workshop represented advocates for a shift to sustainable transport and a wider dialogue is needed with other organisations and groups, so that a range of different views, which may not all be so supportive, can be represented. In addition, the workshop discussions took place over a morning and necessarily could not cover all the topics relevant to shifting to a sustainable transport system. For example, one such omission was land-use policy, which was not discussed explicitly but can have an important impact on car use and distances travelled.

### **Conclusions**

The climate emergency can be a lever for changing how we travel and climate change targets will fundamentally change how all organisations operate. The changes necessitated by Covid-19 provide further impetus to adapt how we work, to reduce the necessity to travel and to use less carbon intensive forms of travel. The Spaces for People programme funding temporary active travel infrastructure in Scotland is a good example of what can be achieved in a short space of time (Sustrans 2020).

Nationally, the Scottish Government needs to back up its strong policy commitments toward a low carbon transport system with significantly increased investment in sustainable transport while reducing its roads budget. Local and regional transport authorities need to be given the resources to drive this investment, and the flexibility to adapt transport systems in the differing urban and rural environments across Scotland. This will require leadership at all levels and also funds.

There is strong evidence that whole town/city interventions which may contain many intervention types are more effective in creating a 'whole system' change than localised single mode interventions, and that this success has been achieved in the UK (Department for Transport, 2017). Additionally, it is important to integrate 'hard' and 'soft' transport measures, for example combining

new services or infrastructure with appropriate messaging and incentives to encourage use (Cairns *et al.* 2016).

This needs to be a just transition. Too many people suffer transport inequalities currently, not least women and ethnic minorities. Investment should support vulnerable population groups and communities most in need; without this approach these inequalities will remain or widen.

However, we need to move swiftly from policy to action. Targets for reaching net-zero emissions in Glasgow and Edinburgh by 2030 are already challenging; we have to accelerate progress toward a low carbon transport system or risk setting our sights on increasingly unattainable goals.

As a coda, as was mentioned at the workshop, the challenge posed by climate change may, ironically, provide the biggest opportunity yet to improve population health.

Funding: None.
